Abstract (en)

[origin: EP0748733A1] The unlocking device is for a window (1) fixed to a frame, with an unlocking element to release it from the frame. A power element (2) is provided to turn or push the window out of the frame when it is operated. It may be possible to push the window from a closed position to an open position within the frame. In the closed position, it may be loaded by a spring (4) in the open-position direction, and held in the closed position by an arresting member, namely the power element. This may be fixed to the frame, and has a retractable locking pin (5) to fit in a recess in the window.
