Abstract (en)
[origin: EP0749136A2] The switch has a tubular housing (1) contg. an axially movable button (10) for actuating a switching element attached to the housing. The button can be depressed against a restoring force (19). The housing has a radially protruding bracket (2) between its front and rear ends. The front and rear surfaces of the bracket form stop surfaces which define the distance of the end surface (9) of the housing from the front side of its mounting plate (31). The housing exterior is bounded by a radially symmetrical, pref. cylindrical casing.
