Abstract (en)
[origin: DE19548537A1] The micro-infusion device consists of a capillary infusion piece (1), which via a connecting part (2) is connected with a male Luer connector (4) with its locking thread (7) and Luer connecting cone (5) with a central hole (6). A connecting part (3) connects the capillary infusion piece via the cylindrical housing (8) containing a particle-bacteria filter (12) with a female Luer connector (9), its inner Luer cone (10) and a locking component (11). The micro-infusion device incorporates at least one capillary and comprises a flat baseplate, in which the capillary is formed as a stamped longitudinal groove, covered by a flat cover plate. The base and cover plates are of metal, silicon, glass or ceramic.
