Abstract (en)

[origin: WO9524286A1] A nozzle (4) for a fuel valve (1) for an internal combustion engine is manufactured by exposing an isotropic finely grained powder in a form having substantially the desired external nozzle shape to a pressure of at least 800 bar and a temperature of at least 1000 DEG C for at least 1 hour, whereupon a flow passage with a number of nozzle holes (5) is machined in the nozzle blank thus HIP-treated. The nozzle may be HIP-treated from a cobalt-based alloy, such as Stellite 6, or a nickel-based alloy comprising 20-30 % of Cr, 4-8 % of Al and 0.2-0.55 % of C and possibly W, Hf, Nb, Mo, Si, Y and/or Fe in amounts of 1.8 %. The HIP-treated nozzle (4) has a substantially greater fatigue strength and is easy to machine into its final shape.
