Abstract (en)

[origin: WO9621221A1] A method using the algebraic index CELP coding technique. The search for CELP excitation comprises calculating certain components of covariance matrix $U = H \langle T \rangle H$ where H is a lower triangular Toeplitz matrix formed from the impulse response of a filter consisting of synthesis filters and a perceptual weighting filter. The stored covariance matrix components are only those of pattern $U(\text{posi}, p, \text{posi}, p)$ and those of pattern $U(\text{posi}, p, \text{posj}, q)$, where posi, p and posj, q are the i position and the j position respectively for pulses p and q in the algebraic index codes.
