Abstract (en)  
[origin: EP0749936A2] The support arm (4) can be raised or lowered in relation to the ground (3) by a movement spindle (9) acting directly or indirectly. A basic body (14) of the support arm extends linearly and supports an angle extension (15) at its free end (6). The basic body of the support arm and of the angle extension has recesses in which ribs or burls of the angle extension or of the basic body of the support arm engage. The connection of the angle extension to the basic body of the support arm occurs additionally by screwing, rivetting, pressing or adhesion. The angle extension is formed with a rigid or movable support accommodation (7).
