Abstract (en)  
[origin: WO9525825A1] Aluminium foil is composed of an alloy of composition Fe 1.2 - 2.0 %; Mn 0.2 - 1.0 %; Mg and/or Cu 0.1 - 0.5 %; Si up to 0.4 %; Zn up to 0.1 %; balance Al of at least commercial purity. The foil has an average grain size below 5 μm and is continuously recrystallised with a substantially retained rolling texture. The solute elements Mg and/or Cu increase strength without inhibiting continuous recrystallisation.
