Abstract (en)

The motorised roller shutter comprises a braked motor reducer (5) rotating a shutter winding tube (2) held at its ends (6,8) by support webs (3,4). A declutching coupling (11) is interposed between the motor reducer output shaft (10) and the winding tube. This enables, in the de-clutched position, the free rotation of the tube relative to the reducer under the influence of a force exerted directly on the shutter. A return spring (12), constrained during unwinding of the shutter, exerts a return couple on the winding tube. This causes tube rotation in the direction of shutter winding when a push is exerted on the shutter to open it. The winding tube is rotated by the reducer.

Abstract (fr)

L'invention a trait à un volet roulant motorisé comprenant un motoréducteur à frein (5) pour l'entraînement en rotation d'un tube d'enroulement (2) d'un tablier maintenu à ses extrémités (6, 8) par des joues supports (3, 4). Ce volet roulant est caractérisé en ce qu'il comporte des moyens de liaison débrayables (11) interposés entre l'arbre de sortie (10) du motoréducteur (5) et le tube d'enroulement (2) autorisant, en position de débrayage, la libre rotation de ce dernier par rapport au motoréducteur (5) sous l'influence d'une action exercée directement sur ledit tablier.
