Abstract (en)
[origin: EP0751585A1] The end angle has retaining arms (1,2) for engaging behind the carrier rail side edges, at least one of the retaining arms being sprung in the sideways direction and both retaining arms providing a tension strap for the carrier rail position. A pivoted spring compression strap (4) acts on the tension strap and cooperates with the carrier rail edges at its ends (5,6), which are shaped and/or formed of a selected material, to prevent displacement transverse to the end angle. The compression strap allows positioning of the carrier rail edges, via a spring effect.
