Abstract (en)

The improvement consists in providing an acoustic filter capable of generating an acoustic resistance which is precise and stable. Such a filter is realized by providing the surface of the transducer bottom base, on which the piezoceramic circular diaphragm abuts, with channels of very small section. By varying the number and section of the channels it is possible to obtain the required precise and repetitive acoustic resistance as well as a response curve in function of the frequency which is sufficiently linear and suitable for the requirements in the telephone field. <IMAGE> <IMAGE>
