Abstract (en)

[origin: EP0752218A2] Fastening arrangement for ski boots, comprising a rack (12) slidably mounted on an instep portion (11) of the upper (10) by means of a stud (14) that is fixed to the rack and is capable of being slidably displaced in a slot-like aperture (12) provided in the instep portion (11) of the boot upper. The invention is substantially characterized in that said rack is capable of being selectively locked in pre-defined positions relative to the upper or vamp of the boot by means of a first rotation by substantially a right angle of said rack with respect to its working position, its being slidably displaced into the new desired position, and its being finally locked in such a new position by means of a second reverse rotation in the opposite direction with respect to said first rotation. This solution is constructively simple and convenient in use.
