Abstract (en)
[origin: EP0752242A2] The water is conveyed by a pump (6), and the air conveyed by a fan (9) and or by the Venturi effect. The medium fed by the pump or fan is conducted into a distributor (4) connected to each nozzle (3) by a separate pipe (5) with roughly the same flow resistance. The flow resistance of the pipe (8) connecting the pump or fan and the distributor is smaller than that between the distributor and the parallel connection of the nozzles. The pipes from the distributor to the nozzles are made of flexible material. The bath (2) has several distributors on opposite sides. The fan has a non-return valve (10) after it.
