Abstract (en)

[origin: DE4411192A1] The present invention relates to a holder for components (4), especially electrical components, directly connected to the board (26). When the electrical component contacts the board, its weight is borne by a holder (30). The plug (10) which forms part of the electrical component or is one of its components, is movably arranged in relation to the socket (34) of the board in such a way that manufacturing tolerances are easily compensated and a connection can be made between the plug and the socket without the imposition on the plug connection of the weight of the electrical component.
