Abstract (en)

[origin: EP0753330A1] The ski has a raised part (6) on the upper surface of the ski and at the level of its sliding zone (5). The ratio of the width of the sole of the ski at this level to the distance separating its lower surface (4) and the base of the boot on its upper surface (7) is between 0.6 and 1.2. A wedge, which is preferably 10 mm thick, can be fixed to the upper surface of the ski. A layer of visco-elastic material is put between the wedge and the upper surface of the ski.
