Abstract (en)

[origin: EP0753645A1] The mobile aid is a freely movable one-piece angled step of which one arm (3,4) forms the tread plate and at least one end has hooks or claws for engaging in the ground. The claws (7) can project from a free edge of the arm and rubber-elastic studs can be fitted on the claws. The arms of the step may be of different length so that the device can be used either way according to the incline.
