Abstract (en)

[origin: EP0753898A1] The assembly includes a metal component (11) which comprises two sheets (15A,15B) superimposed one on the other and held together by means of a rivet (16). The rivet may be formed by a stamping action on the sheets so that each is deformed, with one being pressed into a recess formed in the second sheet. The metal component is intended to be connected to the metallic core (12) of a conductor (13). The core of the conductor is flattened between the two sheets with some of the stranded of the conductor passing through the region of the rivet in order to be trapped by the riveting action. A further section of the metal component is shaped in order to define a number of sockets (19) which are able to receive conductive pegs (21).
