Abstract (en)

[origin: EP0754413A1] The boot (1) consists of an upper (2) with a sole (3) attached to the underside. The upper is made from a more supple material than the sole. The sole is made with a series of upward projections extending from its edge which pass over the foot and have their upper ends joined by fastenings. The projections are moulded in one piece with the sole and positioned symmetrically in relation to the sole's lengthwise axis. They are in four pairs in line with the tow joints, the metatarsal bones, the instep and the base of the tibia. The boot's upper is made from a plastics material which is moulded with recesses to receive the sole projections.
