Abstract (en)

[origin: EP0754827A2] The bearing part (11) has a through passage (17) at least partly accommodating the bearing section (6) and also an unlocking hole. The bearing part has a bolt component, which is formed as bracing part (37) with two sprung braced arms, which snap in the peripheral groove for fixture of the handgrip to the bearing part by arrangement of the bearing section in the through-passage. A tool can be inserted in the unlocking hole, in order to dismantle the handgrip from the bearing part, and the braced arms can be removed outwards from the peripheral groove. The bracing part and the unlocking hole are formed for optical control of the relative position of both arms of the bracing part and for direct removal of the arms with the tool.
