Abstract (en)

[origin: WO9527558A1] The invention concerns a method and device for combining at least two flow media. The device comprises a flow region (1) which is arranged at and/or is formed with the opening of a first chamber (2) and which is formed so as to receive the flow medium passing out of the first chamber and convey it to the outlet (3) of the flow region (1) which is preferably followed by a mixing region. A second chamber (9), which can be filled with a second flow medium, is connected to the flow region and/or the first chamber by at least one first opening element (by-pass opening) (11) for diverting some of the first flow medium from the first chamber into the second. The second chamber is provided with at least one second opening element (second opening) (12) for discharging the second flow medium, forced thereinto by the first flow medium, and which opens out into the flow region (1) or is located in the vicinity thereof. A plurality of first chambers (2) or second chambers(9) can be provided.
