Abstract (en)
[origin: WO9624740A1] A glazing block made of plastic in the injection moulding process, having ribs, running at right-angles to its length, on its upper surface which is to be turned towards the pane of glass. Sets of blocks of different widths and lengths are used in the window glazing process. The aim of the invention is to create glazing blocks which can be better adapted to the task in question without increasing the number of blocks in a set. The solution is found by having a glazing block which is 100 mm to 140 mm long, preferably 120 mm, and has a predetermined breaking point (4) halfway along its length which extends on a line at right-angles to the length, so that the block can be divided into two half-blocks (1, 1').
