Abstract (en)
An underwater breathing apparatus (1) includes a handle by which the cylinder (2) of the breathing apparatus (1) can be grasped and which is able to be attached, together with a collar (6), to the neck (3) of the cylinder (2) without being clamped too tightly or being too free to move, which would be irritating, the attachment being achieved by the tightening of a screw-threaded pin (19) in a hinge (16) defined by two wings (9) of the collar (6) and a central element (17) of the handle (15), the central element (17) of the handle (15) further including a cleft (22) extending substantially transverse the pin (19). <IMAGE>
