Abstract (en)
[origin: WO9529190A1] Molecule comprising a plurality of repeat patterns, especially of the KPR type, which are recognizable by an ectoprotein (on the cell surface) in particular by the CD26 receptor (also known as the DPPIV enzyme). Said patterns are all carried by a peptide matrix enabling their multiple presentation to the enzyme and having an affinity for the latter. Said molecule is the active ingredient of a composition inhibiting the entry of HIV in cells, in particular, for the treatment of a retrovirus-induced infection.
