Abstract (en)
[origin: WO9528532A1] A joining arrangement for joining at least two building elements, in particular for joining at least two wall elements (13) of a partition, has at least two marginal sections (1) that are secured to adjacent building elements and at least one joining member (8) that interconnects said sections. The joining arrangement has the following characteristics: each marginal section (1) has two longitudinal grooves (5) whose bottom is delimited by two parallel lines which form an intermediate gap; the joining member (8) consists of a strip and two parallel marginal beads (10) provided at its longitudinal edges; the marginal beads (10) have an outer surface that matches the bottom of the groove; the thickness of the strip is smaller than the diameter of the marginal beads (10), at least along the marginal beads (10); the thickness of the strip next to the marginal beads (10) is substantially smaller than the width of the gap in the grooves (5) of the marginal sections.
