Abstract (en)
[origin: WO9529431A1] Two vertical bores (9) are sunk into the middle part (2) of a watch case (1), along the 6h-12h axis of the watch case. A metal cylinder (10) with a horizontal bore (12) and a vertical bore (14) is sunk into each of said vertical bores (9). A screw (23) that fastens the armband joint (21) to the side (33) of the middle part (2) is screwed into the horizontal bore (12) provided with a thread (11). A screw (18) that fastens the bottom (3) of the watch case to the middle part (2) is screwed into the vertical bore (14) provided with an inner thread (13). A horizontal and a vertical notch (22) in which the armband joints (21) are partially embedded are provided at the side (33) of the case, next to 6h and 12h. This arrangement eliminates all play of the armband fastening joints (21) and prevents them from turning.
