Abstract (en)

[origin: DE4416091C1] A locking device is fitted in a drive device of a power switch to prevent the switch shaft from rebounding from its off position. The locking device (6) comprises a retainer (7) on the switch shaft (1) and a clamp (10) pivotable about a fixed bearing. The clamp (10) has an arc-shaped aperture to engage with the retainer (7) with considerable overlaps. The clamp (10) is actuated by a working surface on the retainer (7) so that its aperture (17) engages over the retainer (7).
