Abstract (en)  
[origin: EP0757213A2] The displacement movement of the slats (5) from a closed to an open position and vice versa is controlled by a control (15.17.11). In a closed position, the slats are positioned so as to form a preferably convexly outwardly curved surface in relation to their longitudinal axes. The control consists of a slide piece (15) and a carrier (11,17) in the form of pins (11) fitting into elongated holes (17) of different lengths. The clearance on one end (19) of the slide piece is minimal, and at the other end is maximal. The pins fit into guides (22).
