Abstract (en)

[origin: EP0757510A2] A programming unit (12) determines operating phases for microwave cooking, browning and any other processes available, from the user's settings of food-type (8) and cooking duration (9) controls. After pressing the start-button (11), the user receives on-going information, including program completion, from a display unit (10). If checks through the open oven door, or through its transparent panel, show further cooking is needed, the user, selecting a new duration, re-starts the cooker. During a delay, e.g. 4 minutes, imposed in case of any such follow-on instructions, the programmer checks whether the oven door has been opened. If not, the follow-on program reinstates the original program's final conditions, held in memory. Otherwise, a suitable sub-program is interposed, operation being prevented while the door remains open.
