Abstract (en)  
[origin: WO9528857A1] The container (1) has an inner sleeve (3) which contains the spreading compound (4) and which is removably disposed in an outer sleeve (5). The inner sleeve (3) is open on at least one side (2) and comprises a piston (12) which can be penetrated by a threaded spindle (15). The inner sleeve further comprises securing means (6) for locking it in the outer sleeve (5). The threaded spindle (15) and the piston (12) together form co-operating means (11, 14) for delivering the spreading compound (4) which can be moved axially in the longitudinal direction in the container (1) by rotation of the threaded spindle (15) which engages in an internal thread (13) in the piston (12) when the outer sleeve (5) and inner sleeve (3) are in a fixed position relative to each other. The threaded spindle (15) is rotated by means of an actuating element (21), in particular a manually actuatable milled nut (20), disposed externally of the outer sleeve (5). In a position in which it penetrates the piston (12), the threaded spindle (15) is rotatably secured to the inner sleeve (3). The threaded spindle (15) has a connection part (17) which in particular projects out of the inner sleeve (3) and can be detachably coupled in a rotationally rigid manner to a corresponding connection part (20) of the actuating means (21). Replacement of the inner sleeve is considerably facilitated.
