Abstract (en)

[origin: DE4415070A1] The invention is intended to provide a highly aerodynamically effective sail. Sails with laths to stabilise the shape and highly aerodynamically effective split sails are known. The invention combines the advantages of both designs by providing a split sail consisting of a foresail and a mainsail with a foresail consisting of segments and with sail laths in the region of the gaps between the foresail components. The novel sail is intended especially for surfboards.
