Abstract (en)
[origin: EP0758038A1] The cover component (17) on its opposite second long side has at least one securing component (20) which engages in a corresp. recess (19) of the frame (1). The securing component has two downwardly extending spring arms (21), which are secured in a recess of the frame. The securing component is displaceable in the direction of the springing action of the spring arms and is fixed to the cover component. The spring arms are spaced to the lateral inner surface of the recess of the frame in order to absorb the width tolerances of the frame and cover component. The securing component snap-engages on a holding cam (26) on the second long side, and is made of plastic or metal.
