Abstract (en)

[origin: DE4415161A1] In a device for securing automatic machines fitted with a testing device for coins of tokens against fraudulent operations by the withdrawal of an inserted coin (7) attached to a thread (8) on the completion of the testing process, a controllable flap (3) engaging in a through channel (1) is fitted downstream of the testing device. The flap (3) opens an acceptance channel (5) for a genuine coin and diverts a false coin into a return channel (6). To prevent the withdrawal of a coin (7) attached to a thread from the acceptance channel (5), there are comb-like adjacent slots (14) in the movable flap (3) in which the thread (8) of a coin (7) attached to it which has reached the acceptance channel is caught.
