Abstract (en)

[origin: WO9532420A1] A substrate (e.g. skin of unknown type, fabric, or hard surfaces) is characterised by analysing chemicals emanating from the substrate or from a substance (e.g. a test formulation comprising a mixture of volatile chemicals) applied to the substrate. Analysis is preferably done using a volatile chemicals sensor, desirably a sensor comprising an array of conducting polymer sensors. The chemical analysis data obtained in this way may be statistically analysed, e.g. by Euclidian distance mapping or principal component analysis, for ease of handling. Having characterised a surface in this way, products, e.g. cosmetic and cleaning products, may be formulated for optimised performance on that substrate.
