Abstract (en)  
[origin: WO9531330A1] A stock for a corrugated card board laminate, comprising a corrugated card board material which contains a stepped corrugating medium formed with steps and on which first creases, where the corrugated card board material is folded in an inverted V-shape, and second creases, where the corrugated card board material is bent in a V-shaped, are formed alternately to intersect the steps at right angles or angles other than right angles and to be in parallel to each other. The second creases are formed by perforations, and portions which will form the outside at the time of bending are broken along the perforations. Alternatively, the second creases are formed by hinges of a given length positioned alternately along portions, which will form the second creases, and defined by those steps of the corrugated card board material which are crushed, and by cutting lines or slits which extend through the corrugated card board material. According to the invention constituted in the manner described above, it is possible to form the first and second creases from one surface of the corrugated card board material and form the respective creases smoothly and positively by means of the same press machine.
