Abstract (en)
[origin: DE4418788A1] The invention relates to a device for connecting breathing apparatus to a breathing opening in which there is a closable ambient air intake aperture and a release switch for a bottled air supply valve to the breathing apparatus. With such devices it is a drawback if the breathing apparatus is inserted into the mask only at the point of use and thus wastes valuable time. To prevent this, a connector of the invention is designed in such a way that it comprises an adjuster (6) which, with the breathing apparatus (1) connected to the mask, can be manually set between a first position in which the ambient air intake aperture (11) is closed and at the same time the bottled air supply valve (13) is released and a second position in which the ambient air intake aperture is opened and at the same time the bottled air supply valve is locked, especially in its closed position.
