Abstract (en)

[origin: WO9534719A1] The proposed device for securing a frame on a layed rail has, on the bottom section of the rail, a holding unit which grips under the base and can be clamped securely thereon, said holding unit serving to create an easily made and released attachment for a support unit for the frame, said support extending laterally, relative to the position of use, from the base, in particularly substantially horizontal. The holding unit fits over the rail in such a way that a catch grips the latter on one side of the rail when the system is assembled while on the opposite side a clamping unit forces the rail against the catch.
