Abstract (en)

[origin: WO9522827A1] A method and an apparatus for electromagnetically screening electronic appliances such as computer monitors. The inside of the casing (12) surrounding the monitor is provided with an electroconductive screen (31) following the inner walls, which is formed from one metal foil blank (50) by folding or from several metal foil blanks (32, 34, 36) by joining overlapping edges. The folded parts or the edges of two blanks are joined by stapling so that a screening shell of permanently the same shape as the casing is obtained.
