Abstract (en)  
[origin: EP0761142A2] The flat carrier (1) has a lower plate (3) with hinged holder flaps (6), and an upper plate (2) with openings (7), through which the flaps project. In initial positions, the plates are positioned on top of each other. Each opening is part of a passage aperture (8), and a holder flaps is pivoted through this into operational position. A locking projection (10,11) projects into the passage aperture, which is located in the pivot path (9) of the holder flap, and supports it an operational position. Each projection partially defines an opening.
