Abstract (en)

A snowboard binding with angular adjustment having a disk (3) rigidly connected to a snowboard, and a supporting base (5) for a shoe. A pawl (7) is associated with the base and selectively interacts, in contrast with a spring, with holes (12) formed on the disk. The pawl can be activated directly by the user and give a high degree of safety to the binding, keeping the selected angular position fixed even in the presence of snow or water and in case of violent impacts of the snowboard against the snow. <IMAGE>
