Abstract (en)

[origin: EP0761401A2] One wall at least (12) is inclined, including with the opposite one an angle open towards the top. A combined vertical and horizontal movement can be imparted to this wall during knocking-out, typically by a control slide. The wall can be movable horizontally inside the mould (3), after which the latter's walls (11, 12) are moved in the vertical direction by lifting the entire mould. An inclined control face (13) can be provided on a thrust plate (9), the wall sliding on it during lifting and simultaneously moving in the horizontal direction.
