Abstract (en)

[origin: EP0761915A2] The core-side retainers (22) work in conjunction with housing-side retainers (20) and an accommodation channel (26) within the core assembly group (16) for receiving a control component for the core-side retainers. The core assembly group has a bearing body (24), with a cylindrical outer peripheral surface on a cylindrical inner peripheral surface of the core accommodation hole (14). On the bearing body are separately produced axial securing devices (30,42), which extend in a radial direction over the outer peripheral surface and serve for the axial fixture of the core assembly group within the core accommodation hole.
