Abstract (en)

[origin: EP0762454A2] The holder has two connection elements (12,13), which accept the switching mechanism (1) between them and which contact different connections, and two contact elements (14,15) electrically connected to the connection elements and to the external connections of the switching mechanism. At least one of the connection elements is arranged to accept different distance pieces (16), which electrically connect the switching mechanism and connection element, between itself and the switching mechanism so that switching mechanisms of different thicknesses can be used.
