Abstract (en)  
[origin: EP0762456A2] The time switch has a housing with several switch sliders in a circle at the periphery of a time disc and which can be pressed in the radial direction. A radially movable switching element (6) arranged outside the switch slider circle forms a switching finger (8) facing one end of a switch slider surface on one side and forms an actuation surface (9) on the other side. The actuation surface is larger than the end surface of the switching finger. The switching element is spring loaded against the actuation direction of the switch slider (2), and is fixed on the housing relative to the switch slider circle.
