Abstract (en)

[origin: WO9532306A1] A method for detecting a target nucleic acid, which method includes the steps (i) amplifying the target nucleic acid to obtain an amplification product using a polymerase, a first primer with or without a segment noncontiguous to a first priming sequence, and a second primer with or without a segment noncontiguous to a second priming sequence in the presence of an oligonucleotide which is incapable of acting as a primer for the polymerase, wherein the oligonucleotide has at least 5 consecutive nucleotides fully complementary to at least 5 consecutive nucleotides of the first primer; and (ii) detecting the presence of the target nucleic acid by monitoring amplification thereof. In particular, the figure illustrates the method wherein the primer contains a segment noncontiguous to its priming sequence.
