Abstract (en)

[origin: WO9533534A1] The invention relates to a binding device for a snowboard which facilitates fitting and removal operations. The engagement and disengagement of said binding are done at the rear portion thereof, while a rigid rear support is provided for the user when snowboarding. The binding device is comprised of a base (1) fixed to a snowboard, a rear support means (2) movable about an axis (6) and linked to the base (1), an instep maintaining means (30) which is rigidly secured to the rear support means along the axis (7) offset with respect to the axis (6) so that there is a large space for fitting through the rear portion with the rear support means (2) in a tilted position, while providing for simultaneous tightening of the instep when the rear support means (2) is substantially brought back to a vertical position. A locking device (4', 5') is also provided to lock the rear support means (2) in said vertical position.
