Abstract (en)

[origin: WO9534458A1] An intermediate shaft (15) consisting of a solid inner shaft member (30) slidable within a tube member (32). A C-shaped connecting member or clip (40) is inserting into a pair of opposed holes (35) in tube member (32). The ends (42) of connecting member (40) engage a shoulder (33) on the shaft member (30) to prevent the two portions (the shaft member and the tube member) of the intermediate member (15) from disengaging. The shaft member (30) and the tube member (32) are slidable relative to one another to accommodate movement of the front axle and the steering gear mechanism (14).
