Abstract (en)
[origin: EP0764590A1] The container-dispenser consists of the container for the product and a dispensing cap with an outlet (29) and a valve (34) to close it until a pressure is applied to expel the product. The cap is made in at least two sections (7, 8) which are moulded in one piece with a third section (6) and linked to it by hinges (22, 23) made from bridges of the same material, with one of the sections (8) equipped with the outlet. The central section of the dispensing cap has a nozzle (4) which fits into the neck of the container (3) or onto a pump or valve attached to it and is also made in a single moulded piece. The valve can be made from a different-coloured and more supple material than the remainder of the cap.
