Abstract (en)

The detonation front is divided into a main and smaller subsidiary front. The main front is introduced into the expansion chamber (17) with a longer operation time so that the expansion chamber contains combustion gases of the subsidiary front. The operation time of the main front in relation to the subsidiary front is such that the subsidiary front is already completely disintegrated in the expansion chamber when the main front enters the expansion chamber. After the disintegration of the detonation, the gas for extinguishing any residual flames is conducted through a flame-extinguishing barrier (7) with gaps in.

Abstract (de)

Das Abschwächen einer Detonation in einem Behälter- bzw. Rohrleitungssystem durch Aufteilung der anlaufenden Detonationsfront und Zusammenführen in einem Expansionsraum (17,17',30) wird dadurch erheblich effektiver, daß die Aufteilung der Detonationsfront in eine Hauptfront und eine Nebefront erfolgt und das die Hauptfront mit einer längeren Laufzeit in den Expansionsraum (17,17',30) geleitet wird, so daß beim Eintritt der Hauptfront in den Expansionsraum (17,17',30) dieser Verbrennungsgase der Nebefront enthält. <IMAGE> <IMAGE>
