Abstract (en)

[origin: FR2734545A1] The sealing of powder jars comprises a skirt (1) drilled with holes and a removable plug (9). Inside the skirt is a skirt upper part (4) and under its upper horizontal surface (8) is a groove (7) which receives the external sealing ring of the jar annular collar. The upper horizontal surface has a collar (3) projecting from the skirt in which is a notch (5). The notch is marked by a tongue (6) extending from the skirt. One or more of the holes (2) in the cape are sealed by a removable semi rigid rotating plug (9) having a horizontal surface (10). The periphery of this surface is extended by a vertical skirt whose internal lower part has three tenons (13,14). One tenon (13) is shorter than the other two tenons (14) to correspond with the length of the notch.
