Abstract (en)

[origin: WO9523035A1] The invention relates to a flocked article, more particularly based on a foam or a casting compound, for example for seals, in which the flocking material is introduced directly into, more particularly partially embedded in, the surface of the article. The invention also relates to a process for flocking an article, more particularly based on a foam or a casting compound, in which the flocking material is introduced directly into the incompletely solidified surface of the article, more particularly of the foam or casting compound. The article consists preferably of a foam produced from at least two foamable reactive components, one of which is an aqueous polymer polyol component and the other an NCO-containing component.
