Abstract (en)

[origin: EP0767125A1] The clip has two relatively movable jaws (2,3) joined by an axle (4) and which clamp the object and are connected to a closure arrangement (7) applying closure pressure pressing the jaws of the clip together. The closure arrangement is movable between a release and closed position. The closure arrangement has two spaced apart facing clamping elements (8,9) resting in a closed position against the non-facing outer sides (17,18) of the clip jaws. The clamping elements are attached to a bracket (10,11) which has a follow-up roller. When closed, the clamping elements each fit into a recess (19) on the outside of each jaw.
